

ABSTRACT OF THE DISCLOSURE

A large mode field diameter optical fiber is disclosed. It is a single mode optical fiber which has a core and a cladding. The core of this fiber has two regions, an inner core region and an outer core region which has a refractive index lower than that of the inner core region. The inner core region is doped with a rare-earth element, such as Er_2O_3 , and a co-dopant, such as Al_2O_3 , and the outer core region is doped with a dopant such as GeO_2 . The types and amounts of the dopants and co-dopants are adjusted to obtain a fiber with a mode field diameter greater than $5.5\text{ }\mu\text{m}$ at a wavelength of 1550nm .
